At **USC Viterbi...**

Engineering leverages phenomena to create new technologies and new knowledge.

Four generic areas: Sustainability, Health, Security, Enriching Life.

Exponential technology promises the solution of Grand Challenge-like problems.

But it also contains the seeds of powerful unintended consequences → necessitating trustworthiness.

Our students will need advanced skills and knowledge, but also mindsets of growth for a fast changing world.

We aim to provide the blueprint for the new Engineer and to change the conversation.

Outstanding technical competence combined with outstanding character.

*To help engineer a better world **for all humanity***
